

Comparing the difference mindset between application developer and framework developer

Application developer's main focus on specific things which mainly applicable for their particular application but when we think about framework developers, Framework developers must see the software development problem from all perspective since the framework they have developed must be used by most of clients.

We have developed checkin /checkout framework and car rental system which uses this framework. During the development period of these framework and application I have learned so many experiences that have broadened my thinking of the software development. It was a good experience working in this project.

In this application development process we tried to fulfill all the required information for the checkin /checkout framework. But as application development we focused in Car Rental System. I think we developed all requirements for this system. We have also used ten design patterns for developing this framework.

Most design patterns used in our framework are really important and resolve the developer problem of developing a system.

Therefore the difference between the application and framework developer is visible , Application developers mainly focuses on the specific client's requirements which will not be helpful for resolved other similar problem but Framework developers mainly focus on solving the common problem which of multiple requirements . Framework developers can satisfy multiple clients simply by developing framework which can have multiple properly used design patterns.
